

Water Treatment Process

High-Speed Coagulating Sedimentation System/Pre-Settler

Sedimentation separation with three powers all together

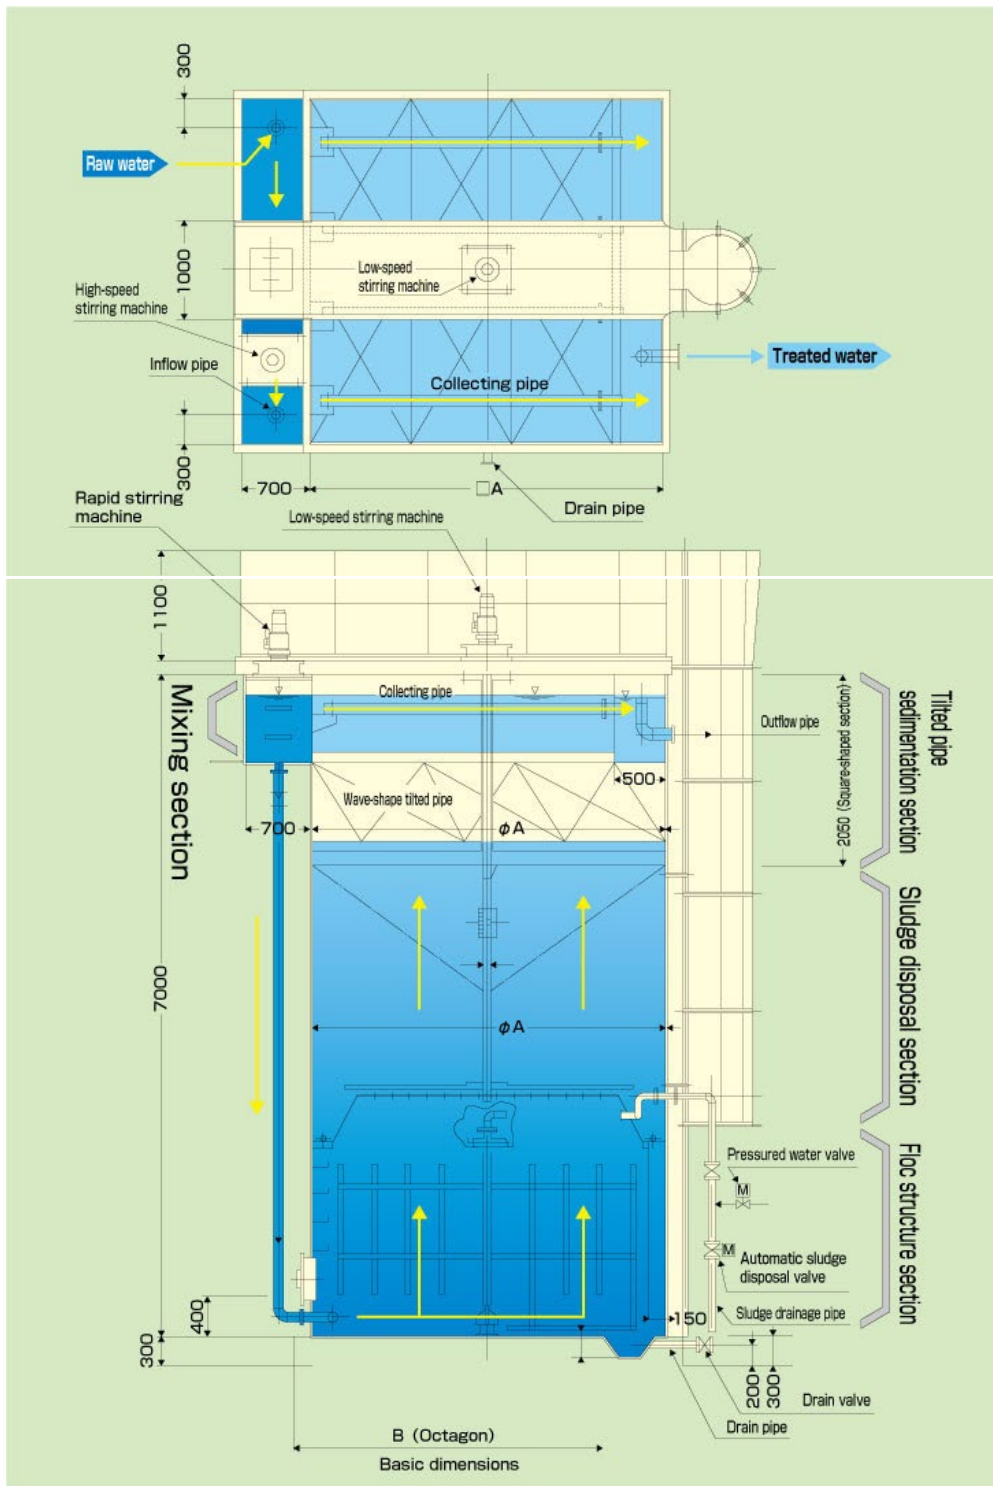

The upflow-type coagulating sedimentation system, consisting of floc structure at the bottom of tank, sludge collection section at the middle, and wave-form tilted pipe at the top, for efficient sedimentation separation.

Features

Compact and upflow-type high-speed coagulating sedimentation system that has three functions of mixing, coagulation, and sedimentation in one tank.

Mechanism

Application

- Pretreatment equipment of filtration equipment in small water supply
